CARINT OUTLOOK FOR FLEXO PRINTING QUALITY: 70 LINES/CM2 IN PRODUCTION

The new frontiers of flexo printing quality are outlined by CARINT with the employment by end users of plates having 70 lines/cm² - 178 LPI in continuous production.

CARINT is pleased to share with the field operators, who will have the opportunity to visit the Company's stand, the prestigious milestone that converters have reached by using the "new generation" Flexographic Printing Presses manufactured by CARINT: a print quality equal to that of rotogravure, with use of plates at 70 lines/cm² -178 LPI.

In connection with the exhibition, CARINT has also organized the traditional "open house" c/o its facility in Pantigliate - Milan, where customers can attend very demanding printing tests, demonstrating that flexography, as understood by CARINT, is no longer considerable as a technology of printing of a lower quality than the rotogravure.

During same event the latest technological developments will be presented to the public and among them to be noted an interesting update on the inking process and colour management.

CARINT will be pleased to meet on its stand, whose references are listed below, all operators of the sector and invites those who may be interested in attending the printing tests to contact the Sales Team at carint@carint.com for organizing their visits.
